

# Roach Clean Out

## What is a roach clean out?

A roach clean out is an intense treatment that allows you to kill 99% of all roaches in one single treatment.

## What is the process?

We use 3 steps (Actisol Fogging, Dust/Bait, Residual)

### Actisol Treatment:

On the initial service, and / or where there is a large population of cockroaches, an actisol clean-out is always recommended. It will allow us to get immediate control by killing off 99% of all living cockroaches. The actisol machine displaces a fog like substance allowing us to penetrate all the cracks, crevices, void areas of all equipment, tile, baseboards, wall voids, and areas that are inaccessible with a liquid or dust application. This is to ensure we find the source of the infestation.

### Dust/Bait/Residual

Dust outlets, plumbing, voids

Residual w/IGR, Gel Bait, Seal

For facilities having a roach infestation we will use three methods to begin your cockroach program. We will use an aerosol product to flush out the roaches hiding in cracks and crevices. Then we will Dust voids and areas where dust is effective. Last, but not least, we will put out a residual liquid application barrier that will give you lasting control.

Bait pucks and gels are great when there are active infestations. Different baits and gels allow cockroaches to eat and carry the chemical back to the colony to share the bait and help kill off the colony of cockroaches.

# Roach Treatment

## What is a roach treatment?

A roach treatment is generally a two service step process that allows us to get control of roaches over a period of about 1 month. It allows us to go through the life cycle stages of the cockroach to eliminate all roaches and stop the process of reproduction.

## What is the process?

We use 3 steps (Aerosol Flush, Dust/Bait, Residual)

## Aerosol Flush/Dust/Bait/Residual:

Dust outlets, plumbing, voids

For facilities having a roach infestation we will use three methods to begin your cockroach program. We will use an aerosol product to flush out the roaches hiding in cracks and crevices. Then we will Dust voids and areas where dust is effective. Last, but not least, we will put out a residual liquid application barrier that will give you lasting control.

Bait pucks and gels are great when there are active infestations. Different baits and gels allow cockroaches to eat and carry the chemical back to the colony to share the bait and help kill off the colony of cockroaches.

Residual w/IGR, Gel Bait, Seal
